# 1 Class Notes

Proof by contradiction:

The aim is to show that a statement  $r$  is true. The method is to show that an implication  $\neg r \rightarrow F$  is true for some statement  $F$  which is false.

## 1.1 Example

Let  $A, B, C$  be sets and  $A \setminus B \in C$ . Show that if  $x \in A \setminus C$  then  $x \in B$ .

*Proof.* By contradiction: Suppose  $x \in A \setminus C$  and  $x \notin B$ , then  $x \in A$  and  $x \notin C$  and  $x \notin B$ . Thus  $x \in A$  and  $x \notin B$  and  $x \notin C$ . Therefore  $x \in A \setminus B$  and  $x \notin C$ . Since  $A \setminus B \in C$ ,  $x \in C$  and  $x \notin C$ , which is a contradiction.  $\square$

## 1.2 Example

Let  $x, y \in \mathbb{R}$ . Show that if  $x^2 + y = 13$  and  $y \neq 4$  then  $x \neq 3$

*Proof.* Indirectly.

Suppose  $x = 3$ , we will show that  $x^2 + y \neq 13$  or  $y = 4$ . Suppose  $x^2 + y = 13$ . Then  $3^2 + y = 13$ ,  $y = 4$ .

Contradiction.

Suppose  $x^2 + y = 13$  and  $y \neq 4$  and  $x = 3$ . Then  $9 + y = 13$  and  $y \neq 4$ . Therefore  $y = 4$  and  $y \neq 4$ , which is a contradiction.  $\square$

## 1.3 Example

Let  $n \in \mathbb{Z}$ . Show that if  $n$  is even then  $n^2$  is even.

*Proof.* Suppose  $n$  is even. Then  $n = 2k$  for some integer  $k$ . Then  $n^2 = 4k^2 = 2(2k^2)$  and  $2k^2 \in \mathbb{Z}$ . Therefore  $n^2$  is even.  $\square$

### 1.3.1 Additional

Show that if  $n^2$  is even then  $n$  is even.

*Proof.* Suppose  $n$  is not even. Since  $n \in \mathbb{Z}$ ,  $n$  is odd.

Then  $n = 2k + 1$  for some  $k \in \mathbb{Z}$  and  $n^2 = (2k + 1)^2 = 4k^2 + 4k + 1 = 2(2k^2 + 2k) + 1$  and  $2k^2 + 2k \in \mathbb{Z}$  Thus  $n^2$  is odd.  $\square$

## 1.4 Example

$\sqrt{2}$  is irrational

*Proof.* By contradiction. Suppose  $\sqrt{2}$  is rational. Then  $\sqrt{2} = \frac{p}{q}$  for some integers  $p, q$  where  $q \neq 0$  and  $\frac{p}{q}$  is reduced ( $p, q$  have no common factors).

Then  $\sqrt{2}q = p$  and so  $2q^2 = p^2$  (\*). From (\*)  $p^2$  is even. Then, by the previous fact,  $p$  is even. Thus  $p = 2k$  for some integer  $k$ .

Thus in (\*) we have  $2q^2 = (2k)^2$ ;  $2q^2 = 4k^2$ ;  $q^2 = 2k^2$ . Therefore  $q^2$  is even, and so  $q$  is even. And so  $p, q$  are both even and  $\frac{p}{q}$  is reduced which is a contradiction.  $\square$

## 1.5 Example

Let  $A, B$  be sets. Show that if  $A \cap B = A$  then  $A \subseteq B$  ( $A \subseteq B \equiv \forall x (x \in A \rightarrow x \in B)$ )

*Proof.* Let  $x \in A$ . Since  $A = A \cap B$ ,  $x \in A \cap B$ . Thus  $x \in A$  and  $x \in B$ . In particular  $x \in B$ .  $\square$

## 1.6 Example

Let  $x \in \mathbb{R}$ . Show that if  $x > 0$  then there is  $y \in \mathbb{R}$   $y(y+1) = x$ .  $\forall x (x > 0 \rightarrow \exists y (y(y+1) = x))$

*Proof.* Let  $x > 0$ . Consider  $y = \frac{-1+\sqrt{1+4x}}{2}$ . Then  $y \in \mathbb{R}$  because  $x > 0$  and  $y(y+1) = (\frac{-1+\sqrt{1+4x}}{2})(\frac{-1+\sqrt{1+4x}}{2} + 1) =$   $\square$
